7.3 Contextual Analysis

Cross-document discrepancies

Inconsistency

Net pay on the salary slip does not match the bank credit

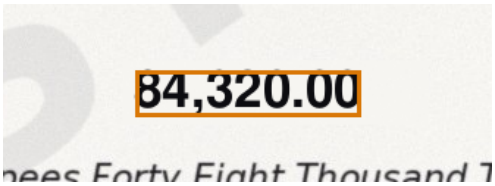

salary_slip.png, page 1 | severity high | confidence 0.92 | cross.salary_vs_bank_credit | Cached LLM reasoning, ollama/qwen2.5:7b

The salary slip states net pay 84,320.00, but the closest salary credit on the bank statement is 48,320.00 ('NEFT CR-KESTREL-SALARY', row 24), a difference of 36,000.00 (42.7%).

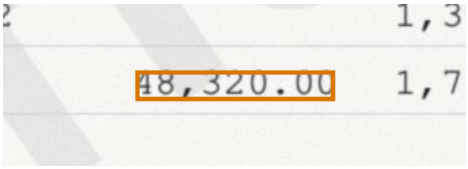

Why it matters: The credited amount should reconcile with net pay, unless something else explains the gap.

Corroboration: 4 other finding(s) concern the same field or region, from independent contextual and visual checks. Independent signals increase the priority for review, but don't establish a conclusion.

Cached AI reasoning (ollama/qwen2.5:7b): The discrepancy between the stated net pay of 84,320.00 on the salary slip and the credited amount of 48,320.00 on the bank statement suggests a potential error or omission. This could be due to a one-time transaction, a mistake in recording, or a delay in payment.

salary_slip.png, page 1
Highlighted region

bank_statement.pdf, page 1
48320.00

Possible benign explanations

- Reimbursements, bonuses or arrears paid together.
- A split salary across accounts.
- Payment on a different date.
- A one-time transaction may have been recorded incorrectly.

Recommended verification

- Ask for payslips and statements for several months.
- Confirm the salary with the employer.
- To confirm: Further bank statements showing the correct amount credited.
- To confirm: A company record indicating a one-time adjustment.

Inconsistency

Declared income is above what the salary slip shows

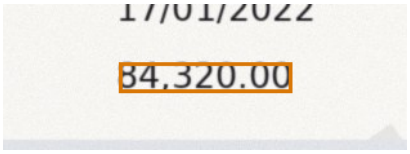

application_form.png, page 1 | severity high | confidence 0.87 | cross.declared_vs_actual_income | Cached LLM reasoning, ollama/qwen2.5:7b

Declared monthly income 84,320.00 on application form (application_form.png) is above the slip's range of net 84,320.00 to gross 54,000.00 by more than 5%. The typical salary credit at the bank, 48,320.00, is also below it.

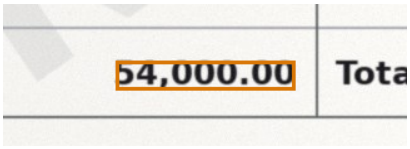

Why it matters: Declared income can be compared with what the supporting documents show.

Corroboration: 5 other finding(s) concern the same field or region, from independent contextual and visual checks. Independent signals increase the priority for review, but don't establish a conclusion.

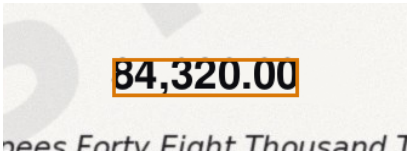

Cached AI reasoning (ollama/qwen2.5:7b): The declared monthly income of 84,320.00 on the application form is significantly higher than the salary slip's net pay of 84,320.00 and gross pay of 54,000.00. This discrepancy could indicate an error in the application form or a misunderstanding of the salary details.

application_form.png, page 1
Highlighted region

salary_slip.png, page 1
54,000.00

salary_slip.png, page 1
84,320.00

Possible benign explanations

- Other income sources not on the slip.
- Annual vs monthly figures.
- Household income declared instead.
- The applicant may have misunderstood the salary details.

Recommended verification

- Ask for evidence of the other income, such as tax returns.
- Clarify what the declared figure includes.
- To confirm: Further salary slips showing a consistent income level.
- To refute: A corrected application form with accurate income details.

Field-level inconsistencies within a document

Inconsistency

Net pay in figures differs from net pay in words

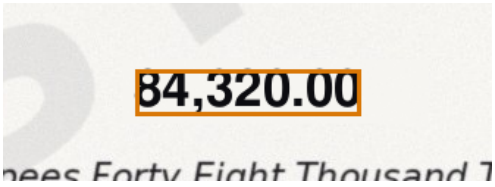

salary_slip.png, page 1 | severity high | confidence 0.95 | context.amount_in_words | Cached LLM reasoning, ollama/qwen2.5:7b

Net pay is printed as 84,320.00 in figures, but as 48,320.00 in words on the same document. The words agree with gross pay minus deductions (48,320.00), so it is the figure that stands apart.

Why it matters: A document's words and figures state the same amount, and an edit to the figure often leaves the words behind.

Corroboration: 4 other finding(s) concern the same field or region, from independent cross-document and visual checks. Independent signals increase the priority for review, but don't establish a conclusion.

Cached AI reasoning (ollama/qwen2.5:7b): The discrepancy between the net pay in figures (84,320.00) and the net pay in words (48,320) suggests an error in the figure, as the words match the expected amount after deductions.

salary_slip.png, page 1
Highlighted region

Possible benign explanations

- A typing error when the document was prepared.
- An OCR misreading of the figure or the words.
- A typographical error during the document creation process.
- A temporary misalignment in the OCR process.

Recommended verification

- Read both values on the original document.
- Compare with the salary credit at the bank.
- To confirm: Further review of the document's creation process.
- To refute: Confirmation that the words and figures were aligned during the document's final edits.

Inconsistency

Net pay does not equal gross pay minus deductions

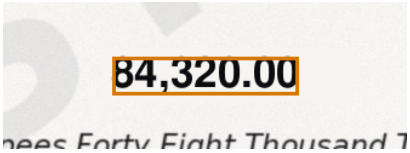

salary_slip.png, page 1 | severity high | confidence 0.95 | context.arithmetic_salary | Cached LLM reasoning, ollama/qwen2.5:7b

Gross pay 54,000.00 minus total deductions 5,680.00 gives 48,320.00, but the document states net pay 84,320.00 (difference 36,000.00).

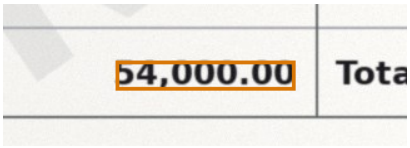

Why it matters: Payroll systems compute these totals, so a broken sum can mean one figure was changed separately.

Corroboration: 4 other finding(s) concern the same field or region, from independent cross-document and visual checks. Independent signals increase the priority for review, but don't establish a conclusion.

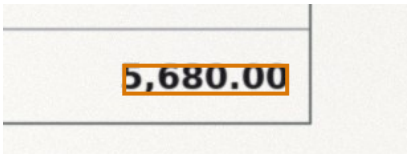

Cached AI reasoning (ollama/qwen2.5:7b): The net pay stated on the document (84,320.00) does not match the recomputed net pay (48,320.00), indicating a discrepancy that could be due to an error in the document or a miscalculation.

salary_slip.png, page 1
Highlighted region

salary_slip.png, page 1
54,000.00

salary_slip.png, page 1
5,680.00

Possible benign explanations

- Unlisted deductions or a rounding policy.
- An OCR misreading of one digit.
- A typographical error during document creation
- A mistake in the OCR process

Recommended verification

- Recompute from a payroll register or Form 16.
- Compare net pay with the bank credit for that month.
- To confirm: Further discrepancies in other fields or documents
- To confirm: Evidence of recent document modifications

Inconsistency

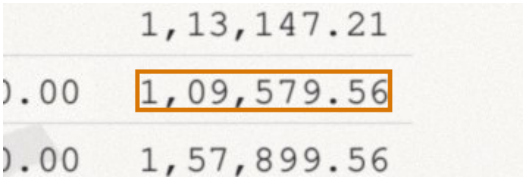

Running balance breaks in the transaction table

bank_statement.pdf, page 1 | severity high | confidence 0.92 | context.arithmetic_balance | Cached LLM reasoning, ollama/qwen2.5:7b

Applying each debit and credit to the previous balance doesn't reproduce the stated balance in 1 row(s): row 19: expected 161,467.21, stated 109,579.56.

Why it matters: Bank systems keep running balances exact, so a break can mean a row was changed.

Cached AI reasoning (ollama/qwen2.5:7b): The running balance breaks at row 19, indicating a discrepancy between the expected and stated amounts. This could be due to an error in the OCR process or a manual alteration of the document.

bank_statement.pdf, page 1
Highlighted region

Possible benign explanations

- An omitted row at a page boundary.
- An OCR misreading of a balance or amount.
- OCR error in reading the amount
- Manual correction or adjustment by a user

Recommended verification

- Get the statement directly from the bank.
- Recompute the affected rows by hand from the image.
- To confirm: Lower OCR confidence for row 19
- To confirm: Evidence of manual edits near row 19

Missing or duplicated information

Document	Missing	Duplicated
id_proof.jpg	None	Date of birth, Person name

7.4 Visual Forensic Findings

Suspicious regions and potential alterations

Potential manipulation **Two regions of this page look copied from one another**

bank_statement.pdf, page 1 | severity high | confidence 0.84 | fused score 0.84 | visual.copy_move | Deterministic reasoning

'NEFT CR-KESTREL-SALARY 48,320.00' appears twice on this page, and the two copies match at 0.998 pixel correlation, including the background grain (0.73). Their mean difference is 1.42 grey levels, against a typical 6.26 for other repeated text on this page. One may have been copied onto the other, or a logo or stamp may be repeated by design.

Why it matters: Near-identical pixel blocks inside one page can come from a cloning edit.

Corroboration: 1 other finding(s) concern the same field or region, from independent cross-document checks. Independent signals increase the priority for review, but don't establish a conclusion.

bank_statement.pdf, page 1
Highlighted region

Possible benign explanations

- A logo, stamp or pattern printed repeatedly by design.
- A genuinely repeated entry that the source system printed identically.
- Repeated logos, watermarks or boilerplate.
- Identical characters in a printed template.

Recommended verification

- Check this entry against the issuer's records.
- Compare this region with the original document or an issuer-held copy.
- Ask for a fresh copy of the document directly from the issuing organisation.
- Inspect both linked regions at full resolution.

Font, alignment and structural inconsistencies

Potential manipulation **Typography differs from other text on the page (3 signals agree)**

salary_slip.png, page 1 | severity high | confidence 0.84 | fused score 0.84 | visual.font_consistency | Cached LLM reasoning, ollama/qwen2.5:7b

'84,320.00' doesn't match comparable text or any style used elsewhere on this page. It differs in: ink darkness, edge sharpness. A value typed in later often uses a different font, weight or ink. Other signals on this region. Error level analysis (confidence 0.44): The text '84,320.00' responds to recompression differently from other words on the page (9.7 robust deviations). Text edited in after the page was created can behave this way, but ELA alone is weak evidence on printed text. Background patch check (confidence 0.68): The paper grain behind '84,320.00' is 0.66x that of the paper just around it (0.95 vs 1.43). That fits a patch laid over the original value, since a patch doesn't carry the page's grain.

Why it matters: Characters that differ in height, stroke or style from their neighbours can indicate an inserted value.

Corroboration: 4 other finding(s) concern the same field or region, from independent contextual and cross-document checks. Independent signals increase the priority for review, but don't establish a conclusion.

Cached AI reasoning (ollama/qwen2.5:7b): The text '84,320.00' appears to be a later insertion, differing in ink darkness, edge sharpness, and responds differently to recompression compared to other text on the page. This could indicate an attempt to manipulate the document by altering a value.

salary_slip.png, page 1
Highlighted region

Possible benign explanations

- Scanner or photocopier artefacts, such as uneven lighting or dust.
- Different compression applied by the device or software that produced the file.
- Legitimate design elements such as shading, stamps or form boxes.
- Bold or emphasized printing that is part of the template.

Recommended verification

- Compare this region with the original document or an issuer-held copy.
- Ask for a fresh copy of the document directly from the issuing organisation.
- Compare with another document issued from the same template.
- Compare the value with the issuer's records.

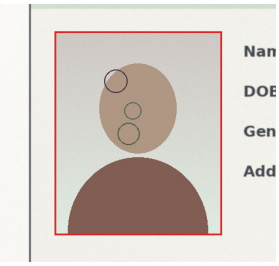

Image manipulation observations

Potential manipulation

Photo differs from the surrounding page

id_proof.jpg, page 1 | severity medium | confidence 0.65 | fused score 0.65 | visual.photo_insert | Cached LLM reasoning, ollama/qwen2.5:7b

This image region shows signs that it wasn't produced together with the page: its smooth areas have almost no grain (0.00) while the page has 1.42, so it wasn't scanned with the page.
Why it matters: A photo whose edges or compression differ from the page can have been pasted in.
Cached AI reasoning (ollama/qwen2.5:7b): The photo has almost no grain (0.00) compared to the surrounding page (1.42), indicating it was likely scanned separately. This could suggest the photo was pasted in, which is a common method for document tampering.

id_proof.jpg, page 1
Highlighted region

Possible benign explanations

- Photos are often attached or printed separately from the form.
- A digital form that embeds a JPEG photo legitimately.
- Photos are often printed or attached separately on genuine IDs.
- Lamination or a scan shadow.

Recommended verification

- Compare the photo with the one on the applicant's ID document.
- Check the physical original for signs of a replaced photo.
- Compare with the issuing authority's record.
- Inspect the photo edges on the physical original.

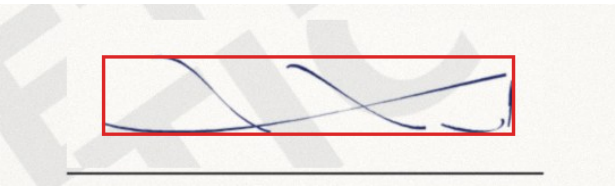

Signature-related observations

Potential manipulation

The same signature pixels appear on two documents

declaration.png, page 1 | severity high | confidence 0.96 | fused score 0.96 | visual.signature_reuse | Cached LLM reasoning, ollama/qwen2.5:7b

The signature on 'declaration.png' matches the one on 'application_form.png' at 1.000 pixel correlation. Pen signatures vary every time they're written, so a near-exact pixel match suggests one image was copied, unless a shared digital signature image is expected here.
Why it matters: Handwritten signatures vary naturally, so near-identical pixels across documents suggest a copy.
Cached AI reasoning (ollama/qwen2.5:7b): The pixel correlation of 1.000 between the signatures on 'declaration.png' and 'application_form.png' suggests a near-exact match, which is unusual for handwritten signatures. This could indicate that one image was copied from the other, unless a shared digital signature was used.

declaration.png, page 1
Highlighted region

Possible benign explanations

- An organisation may apply one digital signature image to every document it issues.
- Both pages may be copies of one signed original.
- A digital signature image applied by the signer themselves.
- An issuer's standard signature stamp.

Recommended verification

- Ask for a freshly signed original.
- Confirm with the issuer whether it uses a digital signature image.
- Ask for a fresh wet signature.
- Check whether the signer normally uses a signature image.

Low-weight observations

Measured facts with weak signals. Each is expected to occur on some genuine documents, and alone none of them is a reason for concern.

Observation	Where	Conf.	Measured
Background is noisier than the surrounding paper	address_proof.pdf, p.1 (1248,264)	0.50	The fine grain in this area is noisier than the rest of the page (0.38 vs 0.05 grey levels). Content pasted or painted in often carries different noise.
Background is noisier than the surrounding paper	address_proof.pdf, p.1 (312,864)	0.50	The fine grain in this area is noisier than the rest of the page (0.26 vs 0.05 grey levels). Content pasted or painted in often carries different noise.
Typography differs from other text on the page	id_proof.jpg, p.1 (950,589)	0.50	'Society,' doesn't match comparable text or any style used elsewhere on this page. It differs in: height, width, chroma, ink darkness. A value typed in later often uses a different font, weight or ink

Typography differs from other text on the page	id_proof.jpg, p.1 (592,1296)	0.40	'05/11/1989' doesn't match comparable text or any style used elsewhere on this page. It differs in: stroke, height, width, ink darkness. A value typed in later often uses a different font, weight or i
Typography differs from other text on the page	id_proof.jpg, p.1 (705,456)	0.40	'05/11/1989' doesn't match comparable text or any style used elsewhere on this page. It differs in: stroke, height, width, ink darkness. A value typed in later often uses a different font, weight or i
Value is off its column edge	salary_slip.png, p.1 (862,306)	0.40	'Pay' is 17.0px away from the left edge that 7 other values on this page share.
Value is off its column edge	salary_slip.png, p.1 (862,358)	0.40	'PAN:' is 17.0px away from the left edge that 7 other values on this page share.
Value is off its column edge	salary_slip.png, p.1 (862,253)	0.40	'Employee' is 17.0px away from the left edge that 7 other values on this page share.

7.5 Evidence and Traceability

Each finding maps to its original document, page and pixel region. Box colours follow the status legend: blue observation, amber inconsistency, red potential manipulation.

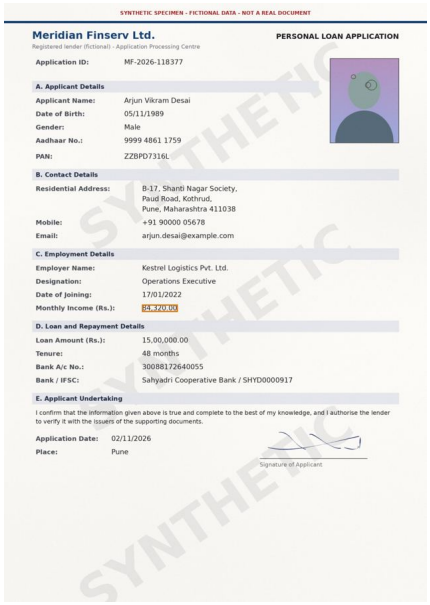

Highlighted regions

salary_slip.png, page 1, 15 highlighted

bank_statement.pdf, page 1, 3 highlighted

application_form.png, page 1, 2 highlighted

declaration.png, page 1, 1 highlighted

id_proof.jpg, page 1, 5 highlighted

address_proof.pdf, page 1, 2 highlighted

Finding to source map

Finding	Status	Conf.	Primary source	Associated extracted values	Evidence
The same signature pixels appear on two documents	Potential manipulation	0.96	declaration.png, p.1 (1041,1115 to 1405,1185)	None	3 item(s)
Typography differs from other text on the page (3 signals agree)	Potential manipulation	0.84	salary_slip.png, p.1 (463,871 to 633,919)	salary_slip.png: Net pay = 84,320.00 (p.1)	8 item(s)
Two regions of this page look copied from one another	Potential manipulation	0.84	bank_statement.pdf, p.1 (341,1541 to 1317,1561)	None	5 item(s)
Photo differs from the surrounding page	Potential manipulation	0.65	id_proof.jpg, p.1 (212,368 to 488,704)	None	3 item(s)

Finding	Status	Conf.	Primary source	Associated extracted values	Evidence
Net pay in figures differs from net pay in words	Inconsistency	0.95	salary_slip.png, p.1 (471,879 to 624,910)	salary_slip.png: Net pay = 84,320.00 (p.1)	3 item(s)
Net pay does not equal gross pay minus deductions	Inconsistency	0.95	salary_slip.png, p.1 (471,879 to 624,910)	salary_slip.png: Gross pay = 54,000.00 (p.1); salary_slip.png: Total deductions = 5,680.00 (p.1); salary_slip.png: Net pay = 84,320.00 (p.1)	4 item(s)
Running balance breaks in the transaction table	Inconsistency	0.92	bank_statement.pdf, p.1 (1356,1535 to 1530,1562)	None	2 item(s)
Net pay on the salary slip does not match the bank credit	Inconsistency	0.92	salary_slip.png, p.1 (471,879 to 624,910)	salary_slip.png: Net pay = 84,320.00 (p.1)	3 item(s)
Declared income is above what the salary slip shows	Inconsistency	0.87	application_form.png, p.1 (542,1180 to 676,1203)	application_form.png: Declared monthly income = 84,320.00 (p.1); salary_slip.png: Gross pay = 54,000.00 (p.1); salary_slip.png: Net pay = 84,320.00 (p.1)	7 item(s)
Background is noisier than the surrounding paper	Observation	0.50	address_proof.pdf, p.1 (1248,264 to 1344,288)	None	4 item(s)
Background is noisier than the surrounding paper	Observation	0.50	address_proof.pdf, p.1 (312,864 to 432,888)	None	4 item(s)
Typography differs from other text on the page	Observation	0.50	id_proof.jpg, p.1 (950,589 to 1047,613)	id_proof.jpg: Address = B-17, Shanti Nagar Society, Paud Road, Kothrud, Pune, Maharashtra 411038 (p.1)	3 item(s)
Typography differs from other text on the page	Observation	0.50	salary_slip.png, p.1 (400,251 to 469,278)	salary_slip.png: Person name = Arjun Vikram Desai (p.1)	3 item(s)
Typography differs from other text on the page	Observation	0.50	bank_statement.pdf, p.1 (666,483 to 692,502)	bank_statement.pdf: Statement period = 01-May-2026 to 31-Oct-2026 (p.1)	3 item(s)
Typography differs from other text on the page	Observation	0.40	id_proof.jpg, p.1 (948,666 to 1041,684)	id_proof.jpg: Address = B-17, Shanti Nagar Society, Paud Road, Kothrud, Pune, Maharashtra 411038 (p.1)	3 item(s)
Typography differs from other text on the page	Observation	0.40	id_proof.jpg, p.1 (592,1296 to 744,1318)	id_proof.jpg: Date of birth = 05/11/1989 (p.1)	3 item(s)
Typography differs from other text on the page	Observation	0.40	id_proof.jpg, p.1 (705,456 to 858,478)	id_proof.jpg: Date of birth = 05/11/1989 (p.1)	3 item(s)
Value is off its column edge	Observation	0.40	salary_slip.png, p.1 (862,306 to 909,329)	None	3 item(s)
Value is off its column edge	Observation	0.40	salary_slip.png, p.1 (862,358 to 923,376)	None	3 item(s)
Value is off its column edge	Observation	0.40	salary_slip.png, p.1 (862,253 to 996,277)	None	3 item(s)

7.6 Investigation Summary

6 of 6 document(s) were processed. The system recorded 11 observation(s), 5 inconsistency(ies) and 4 potential manipulation hypothesis(es). Risk level for prioritizing review: high. Highest priority: The same signature pixels appear on two documents; Typography differs from other text on the page (3 signals agree); Two regions of this page look copied from one another. These results are prompts for human review, not conclusions.

AI summary (ollama/qwen2.5:7b): The document analysis indicates a high risk of potential manipulation, primarily due to the presence of identical signatures, inconsistent net pay, and discrepancies in financial calculations. These findings suggest that the documents may have been altered or copied, warranting a thorough human review.

Identified anomalies and supporting evidence

Anomaly	Status	Conf.	Evidence
The same signature pixels appear on two documents	Potential manipulation	0.96	comparison, crop, raw value
Typography differs from other text on the page (3 signals agree)	Potential manipulation	0.84	crop, heatmap, raw value

Anomaly	Status	Conf.	Evidence
Two regions of this page look copied from one another	Potential manipulation	0.84	comparison, crop, heatmap, raw value
Photo differs from the surrounding page	Potential manipulation	0.65	crop, raw value
Net pay in figures differs from net pay in words	Inconsistency	0.95	crop, field ref, raw value
Net pay does not equal gross pay minus deductions	Inconsistency	0.95	crop, field ref, raw value
Running balance breaks in the transaction table	Inconsistency	0.92	crop, raw value
Net pay on the salary slip does not match the bank credit	Inconsistency	0.92	crop, field ref, raw value
Declared income is above what the salary slip shows	Inconsistency	0.87	crop, field ref, raw value

Potential explanations

- An organisation may apply one digital signature image to every document it issues.
- Both pages may be copies of one signed original.
- A digital signature image applied by the signer themselves.
- An issuer's standard signature stamp.
- A shared digital signature was used.
- The documents were created using the same template.
- Scanner or photocopier artefacts, such as uneven lighting or dust.
- Different compression applied by the device or software that produced the file.
- Legitimate design elements such as shading, stamps or form boxes.
- Bold or emphasized printing that is part of the template.
- Handwritten or stamped fill-in on a printed form.
- A template that mixes fonts by design.

Areas requiring additional verification

- Ask for a freshly signed original.
- Confirm with the issuer whether it uses a digital signature image.
- Ask for a fresh wet signature.
- Check whether the signer normally uses a signature image.
- To confirm: Evidence of a shared digital signature being used.
- To refute: A different signature on the documents when re-examined.
- Compare this region with the original document or an issuer-held copy.
- Ask for a fresh copy of the document directly from the issuing organisation.
- Compare with another document issued from the same template.
- Compare the value with the issuer's records.
- Compare with an authentic document from the same issuer.
- Request the original from the issuer, not from the applicant, and compare the region.

Investigation limitations

- OCR and text-layer values are unverified readings; check the source region before relying on one.
- Forensic signals are heuristic. Re-saving, scanning and compression can produce false positives, and a skilled edit can leave no signal, so an absence of findings isn't proof of authenticity.
- Detectors were tuned and measured on a synthetic dataset, so real documents may perform differently.
- Handwriting and languages other than English are not supported.
- No external register, issuer or bank was contacted; only the submitted documents were compared.
- The risk level orders review work. It is not a probability and not a finding about intent.

How this text was produced

Reasoning modes: demo_cache:ollama/qwen2.5:7b, deterministic. An LLM can add reasoning but can't create findings or change a status, a confidence or a location.
